LOW DIELECTRIC ORGANOSILICATE POLYMER COMPOSITE**CROSS REFERENCE TO RELATED APPLICATION**

This application is a 35 U.S.C. § 371 National Phase Entry Application from PCT/KR2004/002104, filed August 20, 2004, and designating the U.S.

TECHNICAL FIELD

[0001] The present invention relates to a nanoporous organosilicate polymer composite and an organosilicate polymer composite film including the same. More particularly, the present invention relates to an ultra-low dielectric, nanoporous organosilicate polymer composite prepared from a single precursor of an organic/inorganic hybrid polymer, which can make high performance integrated circuits used for main devices of information transmission, processing, and storage systems, and an organosilicate polymer composite film including the same.

BACKGROUND ART

[0002] To provide improved performance and cost-effectiveness of multilayer integrated circuits in the electronic field, a recent trend is to increase the density of the multilayer integrated circuits, for example increase the number of memories and logic chips. For this, a chip size has decreased. At the same time, a significant effort has been made in developing a new dielectric material that can decrease the dielectric constant of a dielectric film. A low dielectric film material recently used is silicon dioxide with a dielectric constant of about 3.5 to 4.0. The silicon dioxide has a physical strength and thermal stability sufficient to withstand various chemical or thermal processes related to a semiconductor fabrication method.

[0003] However, recent high performance multilayer integrated circuits require a relatively inexpensive copper conductor with excellent conductivity and a new low dielectric material that can satisfy a dielectric constant of 2.5 or less. Signal retardation and cross-talk phenomena accompanied by a decrease in the size of an integrated circuit act as serious blocking factors

against device performance improvement. To solve such signal retardation and cross-talk problems, studies about a low dielectric material have been actively done. Development of an ultra-low dielectric material requires introduction of nanoscale pores into a dielectric material or film. For this, a thermal decomposition of an organic polymer that can form nanoscale pores is mainly used. However, a recent technology is difficult to control the size and distribution of nanoscale pores to an ideal level. This is because there arise a phase separation phenomenon between a dielectric material and a pore-forming polymer, and thus, the problem of lack of uniformity of the size and distribution of pores.

[0004] Recently, there have been done many studies to develop low dielectric materials based on silicate- and nanoporous silicate- polymers, aromatic polymers, fluorinated aromatic polymers, organic/inorganic composite materials, and the like. In addition to a dielectric constant of 2.5 or less, development of ultra-low dielectric materials also requires improvements of characteristics necessary for a semiconductor device fabrication process and the durability of semiconductor devices, such as thermal stability, mechanical properties, chem.-mech polishing compatibility, etching property, interface compatibility, and electrical properties.

DISCLOSURE OF THE INVENTION

[0005] The present invention provides a dielectric material with a low dielectric constant which is excellent in various characteristics necessary for a semiconductor device fabrication process and durability of a semiconductor device, and a semiconductor device comprising a dielectric film made of the same.

[0006] According to an aspect of the present invention, there is provided a porous organosilicate polymer composite prepared by heating an organic/inorganic hybrid polymer in which an organosilicate polymer is chemically bonded to a radial pore-forming polymer ended with a hydrolyzable alkoxysilyl group and used as a core molecule.

[0007] According to another aspect of the present invention, there is provided a semiconductor device using an organosilicate polymer composite film comprising an organosilicate polymer composite.

[0008] The organosilicate polymer composite film has an ultra-low dielectric constant of 1.40 to 2.00.

BRIEF DESCRIPTION OF THE DRAWINGS

BEST MODE FOR CARRYING OUT THE INVENTION

[0009] Hereinafter, the present invention will be described in detail.

[0010] The present invention provides a copolymer obtained by chemically bonding an organosilicate polymer to an organic pore-forming polymer that

can form nanoscale pores and a preparation method thereof. The present invention also provides a method for preparing an ultra-low dielectric, nanoporous organosilicate polymer composite or organosilicate polymer composite film using the copolymer as a precursor. The nanoporous organosilicate polymer composite and the organosilicate polymer composite film can have a constant pore size of several nanometers (5-10 nm in diameter). Furthermore, phase separation between the organosilicate polymer and the pore-forming polymer can be prevented, which enables uniform distribution of pores in the organosilicate polymer composite and the organosilicate polymer composite film.

[0011] An organic/inorganic hybrid polymer according to the present invention is prepared by the following process.

[0012] First, a radial pore-forming polymer and an organosilicate polymer are mixed and a solvent is added thereto to form a uniform mixture. The solvent may be tetrahydrofuran, toluene, 1,3-dioxane, 1,4-dioxane, ethanol, or a mixture thereof. A mixed solvent of toluene and ethanol (1:1 by volume) is preferable. Preferably, the solvent is used in an amount of 500 to 1,500 parts by weight, based on the total weight (100 parts by weight) of the radial pore-forming polymer and the organosilicate polymer. A desired pore distribution in a finally obtained organic/inorganic hybrid polymer can be accomplished by appropriately adjusting the mixture weight ratio of the radial pore-forming polymer and the organosilicate polymer. Preferably, the mixture weight ratio between the radial pore-forming polymer and the organosilicate polymer is in a range of 1:99 to 40:60. If the ratio of the radial pore-forming polymer is outside the range, formation of nanoscale pores may be difficult. Furthermore, gelation of a synthesized hybrid polymer may easily occur, which renders the creation of a uniform solution of it in a solvent difficult.

[0013] Next, an acid catalyst is added to the uniform mixture to appropriately adjust the pH of the mixture.

[0014] The acid catalyst may be hydrochloric acid, nitric acid, or sulfuric acid. Preferably, the acid catalyst is an aqueous solution of hydrochloric acid with pH of 1.0 to 3.0. An aqueous solution of hydrochloric acid with pH 2.0 is used

in a volume corresponding to 2 to 4 times of the total weight of the organosilicate polymer.

[0015] If the pH of the aqueous solution of hydrochloric acid exceeds 3.0, sol-gel polymerization may be retarded, which makes it difficult to prepare a hybrid polymer with an appropriate molecular weight range. On the other hand, if it is less than 1.0, sol-gel polymerization may be excessively carried out, which causes easy creation of a polymer gel that is not dissolved in the solvent.

[0016] The reaction mixture that has been adjusted to a desired pH by the addition of the acid catalyst is stirred at room temperature for about one hour. Then, the reaction mixture is raised to a temperature of 40 to 80°C and stirred for 3 to 6 days. If the reaction temperature is too high or the reaction duration is too long, excessive polymerization may occur, thereby creating an insoluble polymer gel. On the other hand, if the reaction temperature is too low or the reaction duration is too short, it may be difficult to prepare a hybrid polymer with an appropriate molecular weight.

[0017] Through the above-described preparation process, a reactive trialkoxysilyl group of the radial pore-forming polymer and a reactive alkoxysilyl group of the organosilicate polymer are subjected to hydrolysis and dehydrocondensation, to thereby form a chemical linkage between the radial pore-forming polymer and the organosilicate polymer.

[0018] Thereafter, the resultant solution is cooled to room temperature and a distilled water is then added thereto to remove the acid catalyst. A desired organic/inorganic hybrid polymer can be obtained through an appropriate separation process.

[0019] The organic/inorganic hybrid polymer has a structure of chemical linkage between the pure radial pore-forming polymer as a core molecule and the organosilicate polymer, as shown in FIG. 2.

[0020] The separation process can be selected according to the types of the radial pore-forming polymer and the organosilicate polymer used starting materials, but is preferably carried out by the following procedure.

[0021] An excess desiccant such as anhydrous Na_2SO_4 is added to the resultant solution to remove a residual moisture. Then, a solvent is removed

from the resultant product under a reduced pressure to separate an organic/inorganic hybrid polymer having a high viscosity radial pore-forming polymer as a core molecule. A solvent such as pentane is then added to the separated organic/inorganic hybrid polymer to remove a trace of a reaction solvent and dried to obtain the pure organic/inorganic hybrid polymer.

[0022] The radial pore-forming polymer as used herein has a structure as shown in FIG. 1. Referring to FIG. 1, the radial pore-forming polymer includes a central portion and a branch portion. The branch portion has an end functional group X. The end functional group is a hydrolyzable alkoxysilyl group that can chemically bond to the organosilicate polymer. R' of the branch portion may be formed by ring-opening polymerization of one of cyclic organic monomers represented by Formulae 1A through 1D:

Formula 1A

Formula 1B

Formula 1C

Formula 1D

wherein a is 2 to 5.

[0023] That is, the radial pore-forming polymer of the present invention can be prepared by ring-opening polymerization of one of the cyclic organic monomers represented by Formulae 1A through 1D in the presence of polyol, R-(OH)_k (k≥2), followed by reaction with a methoxysilane or ethoxysilane

compound. Preferably, the polyol is di(trimethylolpropane), di(pentaerythritol), or a derivative thereof.

[0024] Examples of the hydrolyzable alkoxy silyl group include -OCONH-(CH₂)₃

-Si(OC₂H₅)₃, -OCH₂CH(CH₃)-CH₂O(CH₂)₃-Si(CH₃)₂(OC₂H₅), -OCH₂CH(OH)-CH₂O(CH₂)₃-Si(CH₃)(OC₂H₅)₂, and -OCH₂CH(OH)-CH₂O(CH₂)₃-Si(CH₃)(OCH₃)₂.

[0025] The central portion of the radial pore-forming polymer has an ether structure selected from the group consisting of aliphatic ethers of C1-C30 and aromatic ethers of C6-C30. Concrete example of the ether includes di(trimethylolpropane), di(pentaerythritol), or a derivative thereof having several end hydroxyl groups.

[0026] The radial pore-forming polymer as used herein is prepared by the following procedure: first, ring-opening polymerization between the polyol constituting the central portion and one of the cyclic organic monomers represented by Formulae 1A through 1D is performed to obtain a radial polymer in which X of FIG. 1 is a hydroxy group (-OH). Then, the radial polymer reacts with a silane compound having an alkoxy group to convert the hydroxyl group into a reactive alkoxy silyl group.

[0027] The radial pore-forming polymer has an ether structure with an end methoxy silyl or ethoxy silyl group represented by the following Formula 4:

Formula 4

wherein n is 2 to 64, R is derived from the polyol, R-(OH)_k (k≥2), X is an end functional group selected from -OCONH-(CH₂)₃-Si(OC₂H₅)₃, -OCH₂CH(CH₃)-CH₂O(CH₂)₃-Si(CH₃)₂(OC₂H₅), -OCH₂CH(OH)-CH₂O(CH₂)₃-Si(CH₃)(OC₂H₅)₂, and -OCH₂CH(OH)-CH₂O(CH₂)₃-Si(CH₃)(OCH₃)₂.

[0028] The radial pore-forming polymer may be represented by the following Formula 5:

Formula 5

wherein R_0 is $-\text{CH}_2\text{O}[\text{CO}(\text{CH}_2)_5\text{O}]_a\text{X}$ and R_1 is $-\text{C}_2\text{H}_5$ or $-\text{CH}_2\text{O}[\text{CO}(\text{CH}_2)_5\text{O}]_a\text{X}$ where X is a substituent selected from $-\text{OCONH}(\text{CH}_2)_3\text{Si}(\text{OC}_2\text{H}_5)_3$,

$-\text{OCH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{O}(\text{CH}_2)_3\text{Si}(\text{CH}_3)_2(\text{OC}_2\text{H}_5)$, $-\text{OCH}_2\text{CH}(\text{OH})\text{CH}_2\text{O}(\text{CH}_2)_3\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$, and $-\text{OCH}_2\text{CH}(\text{OH})\text{CH}_2\text{O}(\text{CH}_2)_3\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$ and a is 2 to 20, and R_4 is a substituted or unsubstituted alkylene group of C1-C30 or a substituted or unsubstituted arylene group of C6-C30.

[0029] Preferably, the radial pore-forming polymer is represented by the following Formula 2 or 3:

Formula 2

wherein X is $-\text{CONH}(\text{CH}_2)_3\text{Si}(\text{OC}_2\text{H}_5)_3$, $-\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{O}(\text{CH}_2)_3\text{Si}(\text{CH}_3)_2(\text{OC}_2\text{H}_5)$, $-\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{O}(\text{CH}_2)_3\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$, or $-\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{O}(\text{CH}_2)_3\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$, and n is 2 to 20,

Formula 3

wherein X is $-\text{CONH}-(\text{CH}_2)_3-\text{Si}(\text{OC}_2\text{H}_5)_3$, $-\text{CH}_2\text{CH}(\text{CH}_3)-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)_2(\text{OC}_2\text{H}_5)$, $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$, or $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$, and n is 2 to 20.

[0030] A radial pore-forming polymer and a preparation method thereof disclosed in Korean Patent Application No. 2003-0041384, filed by the present applicant, can be incorporated herein in its entirety by reference.

[0031] The organosilicate polymer as used herein has a silicon atom with hydrogen, a methyl group, or an ethyl group, and a reactive end alkoxy group with 1 to 5 carbon atoms such as a hydrolyzable methoxy or ethoxy group. The organosilicate polymer has a weight average molecular weight (Mw) of 3,000-20,000 g/mol.

[0032] The organosilicate polymer is not particularly limited but may be that obtained by a sol-gel method based on hydrolysis, dehydrolisis, and polycondensation of one or more silane compounds. Here, the silane compounds are selected from the group consisting of trichlorosilane, methyltriethoxysilane, methyltrimethoxysilane, methyldiethoxysilane, methyldimethoxysilane, ethyltriethoxysilane, ethyltrimethoxysilane, ethyldiethoxysilane, ethyldimethoxysilane, bistrimethoxysilylthane, bistrimethoxysilylthane, bistrimethoxysilylmethane, bistrimethoxysilyloctane, and bistrimethoxysilylhexane. Methyl silsesquioxene, hydrogen silsesquioxene, or ethyl silsesquioxene may also be used as the organosilicate polymer.

[0033] An organic/inorganic hybrid polymer prepared by the above-described method has a weight average molecular weight of 3,000-100,000 g/mol. According to the analytic result of a nuclear magnetic resonance (NMR) spectrum, the organic/inorganic hybrid polymer includes 1 to 50 wt% of the radial polymer and 50 to 99 wt% of the organosilicate polymer.

[0034] The organic/inorganic hybrid polymer with the above characteristics is used as a single precursor for preparation of low dielectric nanoporous organosilicate polymer composite and organosilicate polymer composite film.

[0035] The low dielectric organosilicate polymer composite can be obtained by heating the organic/inorganic hybrid polymer having 1 to 50 wt% of the radial pore-forming polymer at 200 to 500 °C so that sol-gel curing and pore formation are carried out.

[0036] The low dielectric organosilicate polymer composite film can be obtained by spin-coating a uniform solution of the organic/inorganic hybrid polymer in an organic solvent on a substrate followed by heating at 200 to 500 °C for curing and pore formation. Here, the organic solvent may be methylisobutylketone, acetone, methylethylketone, toluene, or a mixture thereof, and may be used in an amount of 50 to 99 parts by weight, based on 100 parts by weight of the organic/inorganic hybrid polymer.

[0037] Preferably, the heating is carried out under an inert gas (nitrogen or argon, for example) or vacuum atmosphere. There are no limitations on the substrate provided that it is used as a support member. For example, the substrate may be a silicon substrate or a glass substrate.

[0038] During the heating, an organosilicate moiety of the organic/inorganic hybrid polymer is cured by sol-gel method. On the other hand, a radial pore-forming polymer moiety is thermally decomposed to form nanoscale pores. A chemical linkage between the radial pore-forming polymer and the organosilicate polymer can prevent phase separation of the radial pore-forming polymer during the thermal curing process. Therefore, the pores formed by the thermal decomposition can be controlled to a nanoscale level and be uniformly distributed in a completely cured organosilicate polymer. The porosity of the organosilicate polymer composite thus prepared varies

depending on the initial content of the radial pore-forming polymer. Generally, the organosilicate polymer composite has a refractive index of 1.40-1.20 at a wavelength of 633 nm, a porosity of 1-40%, and a dielectric constant of 1.40-2.00.

[0039] The thickness of the organosilicate polymer composite film can be controlled by adjusting the concentration of the organic/inorganic hybrid polymer in the uniform solution and the rotation speed of the spin-coating.

[0040] As described above, an organic/inorganic hybrid polymer according to the present invention has a radial pore-forming polymer. Therefore, nanoscale pores can be uniformly formed in an organosilicate polymer composite and an organosilicate polymer composite film. The nanoporous organosilicate polymer composite can have a very low dielectric constant, and thus, is suitable as a film material, in particular a dielectric film material, for a next generation, ultra-low dielectric semiconductor device. When the organosilicate polymer composite film is used for a semiconductor device, it is preferable to set the thickness of the organosilicate polymer composite film to a range of 50 to 2,000 nm.

[0041] Examples

[0042] Hereinafter, the present invention will be described more specifically by Examples. However, the following Examples are provided only for illustrations and thus the present invention is not limited to or by them.

[0043] Synthesis Example 1: Radial (ϵ -caprolactone) polymer (Mw (weight average molecular weight)=8,000 g/mol) (X of Formula 2 is $-\text{CONH}-(\text{CH}_2)_3-\text{Si}(\text{OC}_2\text{H}_5)_3$)

[0044] 40g (344.5 mmol) of ϵ -caprolactone and 2g (8.5 mmol) of di(trimethylol)propane were loaded in a completely dried reactor, stirred, and heated at 110°C under a nitrogen atmosphere. When a reaction mixture become transparent after being completely molten mixed, 4 mL of 1% toluene solution containing stannous 2-ethylhexanoate of an amount corresponding to 1/100 mole of the di(trimethylol)propane was added thereto. The reactor containing

all the reactants was continuously stirred at 110°C for 24 hours. After the reaction was terminated, a synthesized polymer was dissolved in a small quantity of tetrahydrofuran and a cold methanol was then added thereto to induce precipitation of the polymer. The precipitated polymer was separated and vacuum dried to give a white 4-branched radial polymer (intermediate) (yield: 90% or more) where M_w is 7,000 g/mol and X of Formula 2 is hydrogen.

[0045] 12.0 g of the radial polymer was loaded in a completely dried reactor and 200 mL of tetrahydrofuran was then added thereto. The reaction mixture was completely dissolved by stirring to obtain a transparent and uniform mixed solution. 6.0 g of 3-isocyanatopropyl triethoxysilane was added to the mixed solution and stirred at 60°C under a nitrogen atmosphere for 48 hours. After the reaction was terminated, a solvent was removed from the resultant solution under a reduced pressure followed by addition of pentane to give a 4-branched radial polymer (polymer A) where M_w is 8,000 g/mol and X of Formula 2 is $-\text{CONH}-(\text{CH}_2)_3-\text{Si}(\text{OC}_2\text{H}_5)_3$ with a reactive end triethoxysilane group. The radial polymer was separated by deposition and then vacuum dried. Yield was 90% or more. The presence of the polymer A was identified by infrared (IR) spectrum and nuclear magnetic resonance (NMR) spectrum (see FIGS. 8A through 8C).

[0046] Synthesis Example 2: Radial (ϵ -caprolactone) polymer (X of Formula 3 is $-\text{CONH}-(\text{CH}_2)_3-\text{Si}(\text{OC}_2\text{H}_5)_3$)

[0047] A white 6-branched radial polymer where X of Formula 3 is hydrogen was synthesized in the same manner as in Synthesis Example 1 except that 20g (175 mmol) of ϵ -caprolactone, 0.9g (3.6mmol) of di(pentaerythritol), and stannous 2-ethylhexanoate of an amount corresponding to 1/100 moles of the di(pentaerythritol) were used. Yield was 90% or more and M_w was 8,000 g/mol.

[0048] 10 g of the radial polymer reacted with 8 g of 3-isocyanatopropyltriethoxysilane in the same manner as in Synthesis Example 1 to give a 6-branched radial polymer (polymer B) where M_w is 9,000 g/mol and X of Formula 3 is $-\text{OCONH}-(\text{CH}_2)_3-\text{Si}(\text{OC}_2\text{H}_5)_3$ with a reactive end

triethoxysilane group. Like in Example 1, the presence of the polymer B was identified by NMR and IR (see FIGS. 9A through 9C).

[0049] Example 1-1: Preparation of organic/inorganic hybrid polymer having radial (ϵ -caprolactone) polymer (X of Formula 2 is $-\text{CONH}-(\text{CH}_2)_3-\text{Si}(\text{OC}_2\text{H}_5)_3$) as pore-forming polymer

[0050] 1 g of a radial (ϵ -caprolactone) polymer ($M_w = 8,000$ g/mol) (X of Formula 2 is $-\text{CONH}-(\text{CH}_2)_3-\text{Si}(\text{OC}_2\text{H}_5)_3$) and 9 g of methyl silsesquioxene ($M_w = 3,000$ g/mol) were loaded in a completely dried reactor and 100 mL of a mixed solvent of toluene and ethanol (1:1, by volume) was then added thereto. The reaction mixture was uniformly stirred at room temperature under a nitrogen atmosphere. 30 mL of an aqueous solution of hydrochloric acid (pH 2.0) was gradually added to the reaction mixture.

[0051] All the reactants in the reactor were continuously stirred at room temperature for one hour and then maintained at 60°C for 4 days.

[0052] After the reaction was terminated, the resultant solution was cooled to room temperature and a distilled water was then added thereto to remove the hydrochloric acid used as a catalyst by extraction. Then, excess anhydrous Na_2SO_4 was added to the resultant solution to remove a trace of moisture followed by filtration and removal of a reaction solvent under a reduced pressure to give a high viscosity organic/inorganic hybrid polymer intermediate. The organic/inorganic hybrid polymer intermediate was subjected to removal of a residual solvent by addition of pentane and dried to give an organic/inorganic hybrid polymer (yield: 80%) where M_w is 5,000 g/mol, as shown in FIG. 2.

[0053] The presence of the organic/inorganic hybrid polymer was identified by IR spectrum, NMR spectrum, and molecular weight measurement (see FIGS. 4 and 5).

[0054] Example 1-2

[0055] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 5,500 g/mol) was prepared in the same manner as in Example 1-1 except that 2 g of

the radial (ϵ -caprolactone) polymer ($M_w=8,000$ g/mol) (X of Formula 2 is -CONH-(CH₂)₃-Si(OC₂H₅)₃) and 8 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol) were used.

[0056] Example 1-3

[0057] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 5,800 g/mol) was prepared in the same manner as in Example 1-1 except that 3 g of the radial (ϵ -caprolactone) polymer ($M_w=8,000$ g/mol) (X of Formula 2 is -CONH-(CH₂)₃-Si(OC₂H₅)₃) and 7 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol) were used.

[0058] Example 2-1: Preparation of organic/inorganic hybrid polymer having radial (ϵ -caprolactone) polymer (X of Formula 3 is -CONH-(CH₂)₃-Si(OC₂H₅)₃) as pore-forming polymer

[0059] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 6,500 g/mol), as shown in FIG. 2, was prepared in the same manner as in Example 1-1 except that 1 g of a radial (ϵ -caprolactone) polymer ($M_w=9,000$ g/mol) (X of Formula 3 is -CONH-(CH₂)₃-Si(OC₂H₅)₃) was used instead of 1 g of the radial (ϵ -caprolactone) polymer ($M_w=8,000$ g/mol) (X of Formula 2 is -CONH-(CH₂)₃-Si(OC₂H₅)₃).

[0060] The presence of the organic/inorganic hybrid polymer was identified by IR spectrum, NMR spectrum, and molecular weight measurement (see FIGS. 6 and 7).

[0061] Example 2-2

[0062] An organic/inorganic hybrid polymer (yield: 80%, M_w : 7,000 g/mol) was prepared in the same manner as in Example 2-1 except that 2 g of the radial (ϵ -caprolactone) polymer ($M_w=9,000$ g/mol) (X of Formula 3 is -CONH-(CH₂)₃-Si(OC₂H₅)₃) and 8 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol) were used.

[0063] Example 2-3

[0064] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 7,700 g/mol) was prepared in the same manner as in Example 2-1 except that 3 g of the radial (ϵ -caprolactone) polymer (M_w =9,000 g/mol) (X of Formula 3 is -CONH-(CH₂)₃-Si(OC₂H₅)₃) and 7 g of the methyl silsesquioxene (M_w = 3,000 g/mol) were used.

[0065] Example 3-1: Preparation of organic/inorganic hybrid polymer having radial (ϵ -caprolactone) polymer where X of Formula 2 is -OCH₂CH(CH₃)-CH₂O(CH₂)₃-Si(CH₃)₂(OC₂H₅) as pore-forming polymer

[0066] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 5,000 g/mol), as shown in FIG. 2, was prepared in the same manner as in Example 1-1 except that a radial (ϵ -caprolactone) polymer where X of Formula 2 is -OCH₂CH(CH₃)-CH₂O(CH₂)₃-Si(CH₃)₂(OC₂H₅) was used instead of the radial (ϵ -caprolactone) polymer (M_w =8,000 g/mol) (X of Formula 2 is -CONH-(CH₂)₃-Si(OC₂H₅)₃).

[0067] Example 3-2

[0068] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 5,200 g/mol) was prepared in the same manner as in Example 3-1 except that 2 g of the radial (ϵ -caprolactone) polymer (M_w is 8,000 g/mol) (X of Formula 2 is -OCH₂CH(CH₃)-CH₂O(CH₂)₃-Si(CH₃)₂(OC₂H₅)) and 8 g of the methyl silsesquioxene (M_w = 3,000 g/mol) were used.

[0069] Example 3-3

[0070] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 6,000 g/mol) was prepared in the same manner as in Example 3-1 except that 3 g of the radial (ϵ -caprolactone) polymer (X of Formula 2 is -OCH₂CH(CH₃)-CH₂O(CH₂)₃-Si(CH₃)₂(OC₂H₅)) and 7 g of the methyl silsesquioxene (M_w = 3,000 g/mol) were used.

[0071] Example 4-1: Preparation of organic/inorganic hybrid polymer having radial (ϵ -caprolactone) polymer where X of Formula 3 is $-\text{OCH}_2\text{CH}(\text{CH}_3)-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)_2(\text{OC}_2\text{H}_5)$ as pore-forming polymer

[0072] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 6,400 g/mol), as shown in FIG. 2, was prepared in the same manner as in Example 2-1 except that a radial (ϵ -caprolactone) polymer ($M_w = 9,100$ g/mol) (X of Formula 3 is $-\text{OCH}_2\text{CH}(\text{CH}_3)-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)_2(\text{OC}_2\text{H}_5)$) was used instead of the radial (ϵ -caprolactone) polymer ($M_w=9,000$ g/mol) (X of Formula 3 is $-\text{CONH}-(\text{CH}_2)_3-\text{Si}(\text{OC}_2\text{H}_5)_3$).

[0073] Example 4-2

[0074] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 7,000 g/mol) was prepared in the same manner as in Example 4-1 except that 2 g of the radial (ϵ -caprolactone) polymer ($M_w = 9,100$ g/mol) (X of Formula 3 is $-\text{OCH}_2\text{CH}(\text{CH}_3)-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)_2(\text{OC}_2\text{H}_5)$) and 8 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol) were used.

[0075] Example 4-3

[0076] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 7,400 g/mol) was prepared in the same manner as in Example 4-1 except that 3 g of the radial (ϵ -caprolactone) polymer ($M_w = 9,100$ g/mol) (X of Formula 3 is $-\text{OCH}_2\text{CH}(\text{CH}_3)-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)_2(\text{OC}_2\text{H}_5)$) and 7 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol) were used.

[0077] Example 5-1: Preparation of organic/inorganic hybrid polymer having radial (ϵ -caprolactone) polymer where X of Formula 2 is $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$ as pore-forming polymer

[0078] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 5,000 g/mol), as shown in FIG. 2, was prepared in the same manner as in Example 1-1 using 1 g of a radial (ϵ -caprolactone) polymer ($M_w = 8,100$ g/mol) (X of Formula 2 is $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$) and 9 g of the

methyl silsesquioxene ($M_w = 3,000$ g/mol).

[0079] Example 5-2.

[0080] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 5,200 g/mol) was prepared in the same manner as in Example 5-1 except that 2 g of the radial (ϵ -caprolactone) polymer ($M_w = 8,100$ g/mol) (X of Formula 2 is $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$) and 8 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol) were used.

[0081] Example 5-3

[0082] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 6,000 g/mol) was prepared in the same manner as in Example 5-1 except that 3 g of the radial (ϵ -caprolactone) polymer ($M_w = 8,100$ g/mol) (X of Formula 2 is $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$) and 7 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol) were used.

[0083] Example 6-1: Preparation of organic/inorganic hybrid polymer having radial (ϵ -caprolactone) polymer where X of Formula 3 is $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$ as pore-forming polymer

[0084] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 6,400 g/mol), as shown in FIG. 2, was prepared in the same manner as in Example 1-1 using 1 g of a radial (ϵ -caprolactone) polymer ($M_w = 9,100$ g/mol) (X of Formula 3 is $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$) and 9 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol).

[0085] Example 6-2

[0086] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 6,900 g/mol) was prepared in the same manner as in Example 6-1 except that 2 g of the radial (ϵ -caprolactone) polymer ($M_w = 9,100$ g/mol) (X of Formula 3 is $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$) and 8 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol) were used.

[0087] Example 6-3

[0088] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 7,400 g/mol) was prepared in the same manner as in Example 6-1 except that 3 g of the radial (ϵ -caprolactone) polymer (M_w = 9,100 g/mol) (X of Formula 3 is $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$) and 7 g of the methyl silsesquioxene (M_w = 3,000 g/mol) were used.

[0089] Example 7-1: Preparation of organic/inorganic hybrid polymer having radial (ϵ -caprolactone) polymer where X of Formula 2 is $-\text{OCH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$ as pore-forming polymer

[0090] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 5,100 g/mol), as shown in FIG. 2, was prepared in the same manner as in Example 6-1 except that a radial (ϵ -caprolactone) polymer (M_w = 8,000 g/mol) (X of Formula 2 is $-\text{OCH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$) was used instead of the radial (ϵ -caprolactone) polymer (X of Formula 3 is $-\text{CH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OC}_2\text{H}_5)_2$).

[0091] Example 7-2

[0092] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 5,500 g/mol) was prepared in the same manner as in Example 7-1 except that 2 g of the radial (ϵ -caprolactone) polymer (M_w = 8,000 g/mol) (X of Formula 2 is $-\text{OCH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$) and 8 g of the methyl silsesquioxene (M_w = 3,000 g/mol) were used.

[0093] Example 7-3

[0094] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 6,000 g/mol) was prepared in the same manner as in Example 7-1 except that 3 g of the radial (ϵ -caprolactone) polymer (M_w = 8,000 g/mol) (X of Formula 2 is $-\text{OCH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$) and 7 g of the methyl silsesquioxene (M_w = 3,000 g/mol) were used.

[0095] Example 8-1: Preparation of organic/inorganic hybrid polymer having radial (ϵ -caprolactone) polymer where X of Formula 3 is $-\text{OCH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$ as pore-forming polymer

[0096] An organic/inorganic hybrid polymer (yield: about 80% or more, M_w : 6,200 g/mol), as shown in FIG. 2, was prepared in the same manner as in Example 1-1 using 1 g of a radial (ϵ -caprolactone) polymer ($M_w = 9,000$ g/mol) (X of Formula 3 is $-\text{OCH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$) and 9 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol).

[0097] Example 8-2

[0098] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 6,900 g/mol) was prepared in the same manner as in Example 8-1 except that 2 g of the radial (ϵ -caprolactone) polymer ($M_w = 9,000$ g/mol) (X of Formula 3 is $-\text{OCH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$) and 8 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol) were used.

[0099] Example 8-3

[0100] An organic/inorganic hybrid polymer (yield: about 80%, M_w : 7,500 g/mol) was prepared in the same manner as in Example 8-1 except that 3 g of the radial (ϵ -caprolactone) polymer ($M_w = 9,000$ g/mol) (X of Formula 3 is $-\text{OCH}_2\text{CH}(\text{OH})-\text{CH}_2\text{O}(\text{CH}_2)_3-\text{Si}(\text{CH}_3)(\text{OCH}_3)_2$) and 7 g of the methyl silsesquioxene ($M_w = 3,000$ g/mol) were used.

[0101] The following Examples show formation of ultra-low dielectric films using the organic/inorganic hybrid polymers according to the above Examples as single precursors.

[0102] Example 9-1: Formation of ultra-low dielectric organosilicate polymer composite film

[0103] 1 g of the organic/inorganic hybrid polymer of Example 1-1 was uniformly dissolved in 9 g of methylisobutylketone to prepare a mixed solution. The mixed solution was spin-coated on a silicon substrate at about 1,000-5,000 rpm to form a thin film. The thickness of the thin film was about 100 nm.

[0104] The thin film thus prepared was raised to 400°C under a nitrogen atmosphere at a rate of 2°C/min and maintained at the same temperature for 60 minutes. At this time, the organosilicate polymer contained in the thin film was thermally cured and the radial pore-forming polymer was thermally decomposed at 250°C or more to form pores in the thin film. After the thermal treatment, the thin film was cooled at the same rate as the temperature raising rate to give a nanoporous organosilicate polymer composite film with an ultra-low dielectric constant as shown in FIG. 3.

[0105] A thin film made of only methyl silsesquioxene has a refractive index of about 2.30-3.00. Polymer composite films according to Examples of the present invention had a relatively low refractive index due to the presence of nanoscale pores, as compared to the thin film made of only methyl silsesquioxene.

[0106] The nanoporous organosilicate polymer composite film of this Example had a dielectric constant of 2.140 ± 0.020 .

[0107] Example 9-2

[0108] An organosilicate polymer composite film was formed in the same manner as in Example 9-1 except that 1 g of the organic/inorganic hybrid polymer of Example 1-2 was used instead of the organic/inorganic hybrid polymer of Example 1-1.

[0109] The organosilicate polymer composite film had a dielectric constant of 1.880 ± 0.020 .

[0110] Example 9-3

[0111] An organosilicate polymer composite film was formed in the same manner as in Example 9-1 except that 1 g of the organic/inorganic hybrid polymer of Example 1-3 was used instead of the organic/inorganic hybrid polymer of Example 1-1.

[0112] The organosilicate polymer composite film had a dielectric constant of 1.740 ± 0.040 .

[0113] Example 10-1: Formation of ultra-low dielectric organosilicate polymer composite film

[0114] 1 g of the organic/inorganic hybrid polymer of Example 2-1 was uniformly dissolved in 9 g of methylisobutylketone to prepare a mixed solution. The mixed solution was spin-coated on a silicon substrate at about 1,000-5,000 rpm to form a thin film. The thickness of the thin film was about 100 nm.

[0115] The thin film thus prepared was raised to 400°C under a nitrogen atmosphere at a rate of 2°C/min and maintained at the same temperature for 60 minutes. At this time, the radial pore-forming polymer contained in the thin film was thermally decomposed to thereby form pores in the thin film. After the thermal treatment, the thin film was cooled at the same rate as the temperature raising rate to give a nanoporous organosilicate polymer composite film with an ultra-low dielectric constant. The nanoporous organosilicate polymer composite film had a dielectric constant of 2.120 ± 0.020 .

[0116] Example 10-2

[0117] An organosilicate polymer composite film was formed in the same manner as in Example 10-1 except that the organic/inorganic hybrid polymer of Example 2-2 was used instead of the organic/inorganic hybrid polymer of Example 2-1.

[0118] The organosilicate polymer composite film had a dielectric constant of 1.850 ± 0.020 .

[0119] Example 10-3

[0120] An organosilicate polymer composite film was formed in the same manner as in Example 10-1 except that the organic/inorganic hybrid polymer of Example 2-3 was used instead of the organic/inorganic hybrid polymer of Example 2-1.

[0121] The organosilicate polymer composite film had a dielectric constant of 1.700 ± 0.040 .

[0122] Example 11-1: Formation of ultra-low dielectric organosilicate polymer composite film

[0123] 1 g of the organic/inorganic hybrid polymer of Example 3-1 was uniformly dissolved in 9 g of methylisobutylketone to prepare a mixed solution. The mixed solution was spin-coated on a silicon substrate at about 1,000-5,000 rpm to form a thin film. The thickness of the thin film was about 100 nm.

[0124] The thin film thus prepared was raised to 400°C under a nitrogen atmosphere at a rate of 2°C/min and maintained at the same temperature for 60 minutes. At this time, the radial pore-forming polymer contained in the thin film was thermally decomposed to thereby form pores in the thin film. After the thermal treatment, the thin film was cooled at the same rate as the temperature raising rate to give a nanoporous organosilicate polymer composite film with an ultra-low dielectric constant. The nanoporous organosilicate polymer composite film had a dielectric constant of 2.040 ± 0.020 .

[0125] Example 11-2

[0126] An organosilicate polymer composite film was formed in the same manner as in Example 11-1 except that 1 g of the organic/inorganic hybrid polymer of Example 3-2 was used instead of the organic/inorganic hybrid polymer of Example 3-1.

[0127] The organosilicate polymer composite film had a dielectric constant of 1.810 ± 0.020 .

[0128] Example 11-3

[0129] An organosilicate polymer composite film was formed in the same manner as in Example 11-1 except that 1 g of the organic/inorganic hybrid polymer of Example 3-3 was used instead of the organic/inorganic hybrid polymer of Example 3-1.

The organosilicate polymer composite film had a dielectric constant of 1.710 ± 0.040 .

[0130] Example 12-1: Formation of ultra-low dielectric organosilicate polymer composite film

[0131] 1 g of the organic/inorganic hybrid polymer of Example 4-1 was uniformly dissolved in 9 g of methylisobutylketone to prepare a mixed solution. The mixed solution was spin-coated on a silicon substrate at about 1,000-5,000 rpm to form a thin film. The thickness of the thin film was about 100 nm.

[0132] The thin film thus prepared was raised to 400°C under a nitrogen atmosphere at a rate of 2°C/min and maintained at the same temperature for 60 minutes. At this time, the radial pore-forming polymer contained in the thin film was thermally decomposed to thereby form pores in the thin film. After the thermal treatment, the thin film was cooled at the same rate as the temperature raising rate to give a nanoporous organosilicate polymer composite film with an ultra-low dielectric constant. The nanoporous organosilicate polymer composite film had a dielectric constant of 2.050 ± 0.020 .

[0133] Example 12-2

[0134] An organosilicate polymer composite film was formed in the same manner as in Example 12-1 except that the organic/inorganic hybrid polymer of Example 4-2 was used instead of the organic/inorganic hybrid polymer of Example 4-1. The organosilicate polymer composite film had a dielectric constant of 1.850 ± 0.020 .

[0135] Example 12-3

[0136] An organosilicate polymer composite film was formed in the same manner as in Example 12-1 except that the organic/inorganic hybrid polymer of Example 4-3 was used instead of the organic/inorganic hybrid polymer of Example 4-1. The organosilicate polymer composite film had a dielectric constant of 1.730 ± 0.040 .

[0137] Example 13-1: Formation of ultra-low dielectric organosilicate polymer composite film

[0138] 1 g of the organic/inorganic hybrid polymer of Example 5-1 was uniformly dissolved in 9 g of methylisobutylketone to prepare a mixed solution. The mixed solution was spin-coated on a silicon substrate at about 1,000-5,000 rpm to form a thin film. The thickness of the thin film was about 100 nm.

[0139] The thin film thus prepared was raised to 400°C under a nitrogen atmosphere at a rate of 2°C/min and maintained at the same temperature for 60 minutes. At this time, the radial pore-forming polymer contained in the thin film was thermally decomposed to thereby form pores in the thin film. After the thermal treatment, the thin film was cooled at the same rate as the temperature raising rate to give a nanoporous organosilicate polymer composite film with an ultra-low dielectric constant. The nanoporous organosilicate polymer composite film had a dielectric constant of 1.990 ± 0.020 .

[0140] Example 13-2

[0141] An organosilicate polymer composite film was formed in the same manner as in Example 13-1 except that the organic/inorganic hybrid polymer of Example 5-2 was used instead of the organic/inorganic hybrid polymer of Example 5-1.

[0142] The organosilicate polymer composite film had a dielectric constant of 1.820 ± 0.030 .

[0143] Example 13-3

[0144] An organosilicate polymer composite film was formed in the same manner as in Example 13-1 except that the organic/inorganic hybrid polymer of Example 5-3 was used instead of the organic/inorganic hybrid polymer of Example 5-1.

[0145] The organosilicate polymer composite film had a dielectric constant of 1.690 ± 0.030 .

[0146] Example 14-1: Formation of ultra-low dielectric organosilicate polymer composite film

[0147] 1 g of the organic/inorganic hybrid polymer of Example 6-1 was uniformly dissolved in 9 g of methylisobutylketone to prepare a mixed solution. The mixed solution was spin-coated on a silicon substrate at about 1,000-5,000 rpm to form a thin film. The thickness of the thin film was about 100 nm. The thickness of the thin film can be adjusted by varying the concentration of the mixed solution or the rotation speed of the spin coating. The thin film thus prepared was raised to 400°C under a nitrogen atmosphere at a rate of 2°C/min and maintained at the same temperature for 60 minutes. At this time, the radial pore-forming polymer contained in the thin film was thermally decomposed to thereby form pores in the thin film. After the thermal treatment, the thin film was cooled at the same rate as the temperature raising rate to give a nanoporous organosilicate polymer composite film with an ultra-low dielectric constant as shown in FIG. 3. The nanoporous organosilicate polymer composite film had a dielectric constant of 2.100 ± 0.030 .

[0148] Example 14-2

[0149] An organosilicate polymer composite film was formed in the same manner as in Example 14-1 except that the organic/inorganic hybrid polymer of Example 6-2 was used instead of the organic/inorganic hybrid polymer of Example 6-1.

[0150] The organosilicate polymer composite film had a dielectric constant of 1.805 ± 0.030 .

[0151] Example 14-3

[0152] An organosilicate polymer composite film was formed in the same manner as in Example 14-1 except that the organic/inorganic hybrid polymer of Example 6-2 was used instead of the organic/inorganic hybrid polymer of Example 6-1.

[0153] The organosilicate polymer composite film had a dielectric constant of 1.710 ± 0.040 .

[0154] Example 15-1

[0155] 1 g of the organic/inorganic hybrid polymer of Example 7-1 was uniformly dissolved in 9 g of methylisobutylketone to prepare a mixed solution. The mixed solution was spin-coated on a silicon substrate at about 1,000-5,000 rpm to form a thin film.

[0156] The thin film thus prepared was raised to 400°C under a nitrogen atmosphere at a rate of 2°C/min and maintained at the same temperature for 60 minutes. At this time, the radial pore-forming polymer contained in the thin film was thermally decomposed to thereby form pores in the thin film. After the thermal treatment, the thin film was cooled at the same rate as the temperature raising rate to give a nanoporous organosilicate polymer composite film with an ultra-low dielectric constant as shown in FIG. 3. The nanoporous organosilicate polymer composite film had a dielectric constant of 2.100 ± 0.020 .

[0157] Example 15-2

[0158] An organosilicate polymer composite film was formed in the same manner as in Example 15-1 except that the organic/inorganic hybrid polymer of Example 7-2 was used instead of the organic/inorganic hybrid polymer of Example 7-1.

[0159] The organosilicate polymer composite film had a dielectric constant of 1.830 ± 0.030 .

[0160] Example 15-3

[0161] An organosilicate polymer composite film was formed in the same manner as in Example 15-1 except that the organic/inorganic hybrid polymer of Example 7-3 was used instead of the organic/inorganic hybrid polymer of Example 7-1.

[0162] The organosilicate polymer composite film had a dielectric constant of 1.680 ± 0.050 .

[0163] Example 16-1: Formation of ultra-low dielectric organosilicate polymer

composite film

[0164] 1 g of the organic/inorganic hybrid polymer of Example 8-1 was uniformly dissolved in 9 g of methylisobutylketone to prepare a mixed solution. The mixed solution was spin-coated on a silicon substrate at about 1,000-5,000 rpm to form a thin film. The thickness of the thin film was about 100 nm.

[0165] The thin film thus prepared was raised to 400°C under a nitrogen atmosphere at a rate of 2°C/min and maintained at the same temperature for 60 minutes. At this time, the radial pore-forming polymer contained in the thin film was thermally decomposed to thereby form pores in the thin film. After the thermal treatment, the thin film was cooled at the same rate as the temperature raising rate to give a nanoporous organosilicate polymer composite film with an ultra-low dielectric constant.

[0166] The nanoporous organosilicate polymer composite film had a dielectric constant of 2.110 ± 0.020 .

[0167] Example 16-2

[0168] An organosilicate polymer composite film was formed in the same manner as in Example 16-1 except that the organic/inorganic hybrid polymer of Example 8-2 was used instead of the organic/inorganic hybrid polymer of Example 8-1.

[0169] The organosilicate polymer composite film had a dielectric constant of 1.790 ± 0.020 .

[0170] Example 16-3

[0171] An organosilicate polymer composite film was formed in the same manner as in Example 16-1 except that the organic/inorganic hybrid polymer of Example 8-3 was used instead of the organic/inorganic hybrid polymer of Example 8-1.

[0172] The organosilicate polymer composite film had a dielectric constant of 1.650 ± 0.040 .

INDUSTRIAL APPLICABILITY

[0173] An organic/inorganic hybrid polymer of the present invention is prepared by chemical linkage between a radial pore-forming polymer with a reactive end group of FIG. 1 and an organosilicate polymer. The organic/inorganic hybrid polymer can be used as a single precursor for formation of an organosilicate polymer composite and an organosilicate polymer composite film, which have nanoscale pores and a low dielectric constant. The organosilicate polymer composite film can be used as a dielectric film for a semiconductor device.
